

FINAL PROJECT ASSIGNMENT

Artificial Intelligence Professional

No-code project for practical AI skills

Deadline	Saturday, 22 August 2026 at 17:00
Project type	Individual

Your goal

Choose one project option from this brief and build a small AI assistant using reusable prompts. You are not expected to code an application. The focus is on choosing a useful problem, writing clear prompts, testing them, improving one of them, and explaining your result in a short presentation.

Important

No coding is required.

No website, database, n8n, Make, Zapier, or API integration is required.

The provided OpenAI API key may be used as an optional extension only. Your grade does not depend on using it.

1. Project at a Glance

Difficulty	Low, beginner friendly
Coding	None required
Main tools	ChatGPT, Claude, Gemini, or another approved AI assistant
Core work	4 reusable prompts, testing, one prompt improvement, simple workflow, short presentation
Presentation	4 to 5 minutes
Deadline	Saturday, 22 August 2026 at 17:00

What every student must do

- Choose one project option from the six options in this document.
- Create 4 reusable prompts for the chosen assistant.
- Test every prompt with a real or realistic example.
- Show both the prompt and the AI output for each test.
- Improve at least 1 prompt. Show the first version and the improved version.
- Create a simple workflow showing how a user moves from a task to a reviewed final output.
- Write 2 short limitations or risks of using AI for the chosen project.
- Prepare a 5-slide presentation and explain the project in your own words.

Simple workflow

Choose a task	Use your prompt	AI creates output	Review the result	Final version
----------------------	-----------------	-------------------	-------------------	----------------------

Human review is part of every option. Do not treat an AI answer as automatically correct. Check important facts, names, dates, prices, instructions, and other details before using the final output.

A good prompt should usually include

- Role: who the AI should act as.
- Task: what you want it to do.
- Context: who the output is for and why it is needed.
- Format: list, table, email, plan, summary, questions, or another clear format.
- Limits: length, tone, language, number of items, or anything the AI should avoid.

2. Project Options

Choose only one option. The four tasks listed under your option are the four prompts you need to create and test.

OPTION 1 | AI Study Assistant

Purpose: Create an assistant that helps a student understand a subject and prepare for study.

Your 4 required prompt tasks

1. Explain a topic to a beginner using simple language and one example.
2. Create a 5-question multiple-choice quiz and provide the correct answers.
3. Summarize a short set of notes into the main idea and key points.
4. Create a short study plan using the subject, available days, and available study time.

Example to test: Use one real subject such as databases, networking, business, English, or another course you know.

Keep in mind: The assistant should support learning, not simply give ready-made exam answers.

OPTION 2 | AI Career Assistant

Purpose: Create an assistant that helps a student prepare professional job application material.

Your 4 required prompt tasks

1. Improve one CV bullet point without inventing experience or achievements.
2. Create a LinkedIn headline and a short About section from provided background information.
3. Write a short professional job application email for a specific role.
4. Create 5 interview questions and give feedback on sample answers.

Example to test: Use your own profile or a fictional graduate profile with simple, realistic details.

Keep in mind: Never ask the AI to invent degrees, jobs, certificates, skills, or results that are not true.

2. Project Options, Continued

OPTION 3 | AI Email Assistant

Purpose: Create an assistant that helps a user write, understand, and improve professional email communication.

Your 4 required prompt tasks

1. Rewrite an informal email into a clear professional email.
2. Create a polite reply to a realistic request from a professor, colleague, or client.
3. Summarize a longer email and extract the important action items.
4. Rewrite the same message in three tones: formal, friendly professional, and very short.

Example to test: Create 2 or 3 fictional email situations and reuse them while testing your prompts.

Keep in mind: Use fictional names and information. Do not paste private company or personal emails into the AI tool.

OPTION 4 | AI Content Creator

Purpose: Create an assistant that helps a small organization, student club, or fictional business plan simple social media content.

Your 4 required prompt tasks

1. Create a 7-day mini content plan with one idea per day.
2. Write one LinkedIn post for a professional audience.
3. Write one Instagram caption for the same topic using a different tone.
4. Take one idea and repurpose it into two different content formats.

Example to test: Use a fictional cafe, student club, training center, local service, or another simple idea.

Keep in mind: The content should be clear and realistic. Avoid fake customer claims, fake statistics, or misleading promises.

2. Project Options, Continued

OPTION 5 | AI Travel Planner

Purpose: Create an assistant that helps a traveler organize a simple trip while clearly separating suggestions from facts that need verification.

Your 4 required prompt tasks

1. Create a 2 or 3-day itinerary based on destination, interests, and available time.
2. Create a practical packing list based on the trip type and season.
3. Create a simple budget table with categories such as transport, food, activities, and accommodation.
4. Compare two travel options using clear criteria such as cost, travel time, activities, and convenience.

Example to test: Use a destination you know or a realistic fictional trip scenario.

Keep in mind: Opening hours, prices, transport schedules, visa rules, and similar details must be checked before real travel decisions.

OPTION 6 | AI Productivity Assistant

Purpose: Create an assistant that helps a student or employee organize tasks, time, and priorities.

Your 4 required prompt tasks

1. Create a realistic weekly plan using fixed commitments and available time.
2. Prioritize a list of tasks and explain the order briefly.
3. Break one larger goal into small steps with simple deadlines.
4. Turn meeting notes or class notes into action items with owners or due dates where relevant.

Example to test: Use a realistic week with classes, work, study, personal tasks, or a small project.

Keep in mind: The plan should be realistic. If the schedule is overloaded, the AI should say so instead of creating an impossible plan.

3. How to Prepare Your Project

Step 1: Write your project purpose

Use 3 to 5 sentences. Explain who the assistant is for, what problem it helps with, and why the problem is useful to solve.

Step 2: Create and test 4 prompts

For each prompt, include the final prompt and one test result. You may use screenshots or copy the relevant output into your report. Keep the examples short enough that the reader can understand what happened.

Step 3: Improve one prompt

Show a weak or first version, then show the improved version. Add 2 or 3 sentences explaining what you changed. For example, you may add a role, clearer context, a better output format, a tone, or a length limit.

Simple example of prompt improvement

First version: "Create a study plan for databases."

Improved version: "Act as a study planner. I have a databases exam in 5 days and I can study 90 minutes per day. Create a realistic 5-day plan in a table. Include one review session and one practice session."

Why it is better: the second prompt gives context, time limits, an output format, and a clear expectation.

Step 4: Draw the workflow

The workflow can be created in PowerPoint, Word, Canva, or another simple tool. It does not need to be technical.

Step 5: Explain limitations and safe use

- Mention at least 2 things the AI may get wrong or misunderstand in your project.
- Explain what the user should check before accepting the output.
- Do not upload sensitive personal, client, company, financial, or confidential information for the project.

4. Submission and Presentation

Submission folder

Submit one ZIP folder using the following naming format:

File name

FirstName_LastName_AI_Final_Project.zip

The ZIP folder should contain:

- Final_Project.pdf
- Presentation.pptx

Suggested structure for Final_Project.pdf

1. Cover page: project title, student name or student names, and chosen option.
2. Project purpose: short description of the problem and intended user.
3. Prompt 1 and test result.
4. Prompt 2 and test result.
5. Prompt 3 and test result.
6. Prompt 4 and test result.
7. Prompt improvement: first version, improved version, and short explanation.
8. Workflow, limitations, and short conclusion.

Presentation: exactly 5 slides

Slide	What to include
Slide 1	Project title, chosen assistant, student name or names.
Slide 2	The problem and who the assistant is for.
Slide 3	The four tasks your assistant can perform.
Slide 4	Your best prompt, test result, and the improvement you made.
Slide 5	Workflow, limitations, and what you learned.

Deadline

Saturday, 22 August 2026 at 17:00

Late submission rules follow the instructions provided by the instructor.

5. Grading

The project is graded on practical use of AI, prompt quality, testing, clear explanation, and responsible use. Technical programming skills are not part of the grade.

Criterion	Points	What is expected
Clear project idea and user	10	The problem is easy to understand and the chosen assistant has a clear purpose.
4 prompts	40	Each prompt is useful, clear, reusable, and connected to the selected project option.
Testing and outputs	10	All four prompts are tested with understandable examples.
Prompt improvement	10	One prompt is improved and the changes are explained.
Workflow	10	The workflow is simple, logical, and includes human review.
Responsible AI use	10	Limitations, verification, and privacy are addressed.
Presentation	10	The presentation is clear, short, and the student can explain the work.
TOTAL	100	

Optional extension

If you want an extra challenge, you may compare the same prompt in two AI tools or demonstrate one prompt using the provided OpenAI API key. This is optional and is not required for a complete project.

6. Final Checklist

- ☐ I selected one project option.
- ☐ I created 4 prompts.
- ☐ I tested all 4 prompts.
- ☐ I included the prompt and result for every test.
- ☐ I improved at least 1 prompt and explained the change.
- ☐ I created a simple workflow.
- ☐ My workflow includes human review.
- ☐ I wrote at least 2 limitations or risks.
- ☐ I did not include sensitive or confidential information.
- ☐ My presentation has exactly 5 slides.
- ☐ I can explain my project without reading everything from the slides.
- ☐ My files are inside one correctly named ZIP folder.
- ☐ I am ready to submit before Saturday, 22 August 2026 at 17:00.

Before you submit

Read your AI outputs. Remove anything that is incorrect, unclear, or irrelevant.

Make sure your examples are understandable to someone who did not work on the project with you.

The final work should reflect your own understanding. You should be able to explain why each prompt was written the way it was.

Good luck with your final project.
